THE NOBULOUS SET · GAME THREE

AoS
Automaton of Shale

Commit everything before you know anything. Precision pays; overkill costs.

You are the Technician running Nobulous' automaton through its paces. Each Program is a row of elements that must all be funded before a single die is rolled — and Nobulous reveals what you may *not* use only after you have already committed the components the Program demands.

COMPONENTS

- 6 Experimental Technician cards
- 24 Program cards (double-sided Stable / Overheated) in three decks of 8: Routine, Specialized, Unstable
- 8 Advanced Program cards (double-sided)
- 6 Limitation cards
- 5 Element allocation mats
- **From 20 Strong:** the 17 unit dice — 4 Purple, 4 Blue, 4 Green, 4 Yellow, 1 Red
- **From 20 Strong:** the 3 stat dice — Health, Strategy and Recovery — and the Chip

SETUP

1. Choose a Technician. All six begin at **2 HP / 2 STR / 3 REC** and differ only in ability.
2. Choose one Program deck — this is your difficulty:

DECK	CHARACTER
Routine	The teaching deck.
Specialized	The intended experience.
Unstable	Experimental. Currently very hard.

3. Shuffle the 6 Limitations into a face-down deck.
4. Shuffle the 8 Advanced Programs and set them aside for the finale.
5. Lay out the element mats. All 17 dice start available.

OBJECT OF THE GAME

Cycle your Program deck three times, then face three Advanced Programs. Finish Advanced Programming with at least 1 Health to win.

RUNNING A PROGRAM

This order matters more than anything else in the game.

1. **Reveal the Program.** It shows a row of elements, each with a Target, and one element ringed as the overheat marker.
2. **Commit required-colour dice.** Every coloured dot beside an element requires one available die of that colour to be placed on that element *now*. These dice are locked there.
3. **Reveal the Limitation.** It withholds dice from your *remaining* pool or imposes a constraint. Dice already locked to required-colour dots are untouched.
4. **Finish the allocation.** Distribute the rest of your available dice across the elements.
5. **Execute.** Roll each element and resolve it.

> **REQUIRED COLOURS**
>
> Red can never satisfy a required-colour dot. A required die counts normally toward its element's Target — it just has to be that colour and it has to be placed before you know what Nobulous is about to take away.

> **IF YOU CANNOT SUPPLY A REQUIRED COLOUR**
>
> Do not reveal a Limitation and do not execute the Program. **Lose 1 Health.** Treat the Program as failed for Stable/Overheated progression, then move on. Running your colours dry has a real cost.

Requirement density

DECK	REQUIRED-COLOUR DOTS PER CARD
Routine	1
Specialized	2
Unstable	1
Advanced	2

The same required colours appear on both faces of a Program card.

Limitations

- Reveal exactly **1** Limitation per Program, always after required-colour dice are committed.
- Yellow / Green / Blue / Purple Shortage: withhold 2 dice of that colour from the remaining pool.
- Diversity Protocol: withhold 2 dice of different non-Red colours.

- Red Quarantine: withhold the Red die.
- Withheld dice return to your pool when the Program ends. Discard the Limitation after that Program.

Allocation threshold

Target +1 dice is the safe allocation threshold for an element, not a hard cap. You may allocate more, but every die beyond Target +1 exhausts after that element resolves regardless of the outcome.

ROLLING AND THE EXHAUSTION GRADIENT

Each element gets one Strategy roll. Additional rolls up to your STR form a **shared pool** spent anywhere in the Program — at STR 2 that is one extra roll for the whole Program.

RESULT	CONSEQUENCE
Exactly meet Target	**Optimal Implementation:** recover 2 exhausted dice.
Beat by exactly 1	No penalty.
Beat by 2 or more	Exhaust 1 die allocated to that element.
Fail the element	Exhaust all dice allocated to that element.
Used an extra STR roll	That element's dice exhaust regardless of outcome.

If an element uses an extra roll *and* lands exactly on Target, both apply: exhaust its dice first, then recover 2 — which may include dice you just exhausted.

> **CATASTROPHIC FAILURE**
>
> Failing exactly one element in a Program costs no Health. Failing **two or more** in the same Program is one Catastrophic Failure and costs 1 Health total.

STABLE, OVERHEATED, SET ASIDE

- When a Stable Program fails, flip it to **Overheated**. The ringed element's Target increases on that face.
- If an Overheated Program fails again on a later appearance, **set it aside**.
- The endgame triggers after you have cycled the Program deck three times.

ADVANCED PROGRAMMING

- Select 3 Advanced Programs. They are longer — 4 or 5 elements — and each carries 2 required-colour dots resolved by the normal pre-allocation rule.
- Recover between Advanced Programs.
- **Tucking:** set-aside Programs may be tucked under the left or right edge of an Advanced Program; the exposed edge Target adds an element. If the marked overheated element is first or last, that edge must be used; if it is internal, you choose.
- Advanced Program 1 begins Stable.
- Ending with 0–1 failed elements: the next Advanced Program begins Stable.
- Ending with 2+ failed elements: suffer Catastrophic Failure (lose 1 Health) and the next Advanced Program begins Overheated.
- Catastrophic Failure does not stop Advanced Programming unless Health reaches 0.

Complete all three with Health remaining to win AoS.

CARRYING AOS FORWARD

Only relevant if you are playing the NRJ campaign.

The **3 Advanced Programs you actually faced** are retained, preserving whether each was Stable or Overheated when faced. Three unused Advanced Programs become candidates. AoS contributes 6 cards to the Research Pool.

Stable retained cards are stronger for reducing Targets in the finale but cannot be discarded to avoid a Scenario; Overheated ones are weaker but can. A clean AoS run changes the *texture* of the finale rather than simply giving you more.
